Jensen M; Smith LA,

2002-575192/61. N-PSDB; ABK98549 Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.

Claim 52; Page 142-144; 166pp; English.

neurotoxin light chain (BONT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T concent that is less than about 70% The BONT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dysfuncias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetisc disorders, cosmetic treatment of facial wrinkles, to control autonomic nerve function or tippce-walking due to stiff the lawer motor neuron, and muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin inhibitors. This sequence to a nucleic acid molecule encoding a botulinum

The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiploe-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin inhibitors. This sequence
                                                                                                       Botulinum neurotoxin light chain; BoNT LC; botulism; dystonia; pain; spasticity; ocular motility; facial dyskinesia; stiff-person syndrome; bladder dysfunction; segmental myoclonus; hyperkinetic disorder; cosmetic treatment; facial wrinkle; cerebral palsy; analgesic; relaxant; lower motor neuron hyperactivity; autonomic nerve function; muscular; immunostimulant; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.
                                                                         Botulinum neurotoxin light chain polypeptide #14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (USSA ) US ARMY MEDICAL RES & MATERIAL COMMAND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 33; Page 145-146; 166pp; English.

Sequence 824 AA;

```
The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BONT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular mortility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiptoe-walking due to stiff control autonomic nerve function or tiptoe-walking due to stiff muscles common in children with cerebral palsy. The sequence are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin inhibitors. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Botulinum neurotoxin light chain; BoNT LC; botulism; dystonia; pain; spasticity; ocular motility; facial dyskinesia; stiff-person syndrome; bladder dysfunction; segmental myoclonus; hyperkinetic disorder; cosmetic treatment; facial wrinkle; cerebral palsy; analgesic; relaxant; lower motor neuron hyperactivity; autonomic nerve function; muscular;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.

Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.

Claim 33; Page 150-151; 166pp; English.

The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and the control autonomic nerve function or tipoe-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin linhibitors. This sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clotridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, cocular motility, facial dysthiesias, stiff-person syndrome, bladder dysfunction, segmental myoclomus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiploe-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin inhibitors. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                   Botulinum neurotoxin light chain; BoNT LC; botulism; dystonia; pain; spasticity; ocular motility; facial dyskinesia; stiff-person syndrome; bladder dysfunction; segmental myoclonus; hyperkinetic disorder; cosmettic treatment; facial wrinkle; cerebral palsy; analgesic; relaxant; lower motor neuron hyperactivity; autonomic nerve function; muscular; immunostimulant; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Check: 4621

```
The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressable in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BONT LC protein is useful in vaccination against botulism, for eliciting protective immunity in amammal, for treating dystonias, spasticity, pain ocular motility, myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin inhibitors. This sequence
                                                                                                                                                                                                  Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.

The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BONT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain ocular motility, mycolonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin inhibitors. This sequence Botulinum neurotoxin light chain; BoNT LC; botulism; dystonia; pain; pagasticity; ocular motility; facial dyskinesia; stiff-person syndrome; bladder dysfunction; segmental myoclonus; hyperkinetic disorder; cosmetic treatment; facial whinkle; cerebral palsy; analgesic; relaxant; lower motor neuron hyperactivity; autonomic nerve function; muscular; Novel nucleic acid molecule encoding borulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium. Botulinum neurotoxin light chain polypeptide #19. (USSA ) US ARMY MEDICAL RES & MATERIAL COMMAND. The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spaticity, pain, ocular mortility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiptoe-walking due to stiff to control autonomic nerve function or tiptoe-walking due to stiff useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin inhibitors. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Botulinum neurotoxin light chain; BoNT LC; botulism; dystonia; pain; spasticity; ocular motility; facial dyskinesia; stiff-person syndrome; bladder dysfunction; segmental myoclonus; hyperkinetic disorder;
  Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |--|

```
The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BONT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonism, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental conditions characterised by hyperactivity of the lower motor neuron, and muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin light chain serotype A protein
  cosmetic treatment, facial wrinkle; cerebral palsy; analgesic; relaxant; lower motor neuron hyperactivity; autonomic nerve function; muscular; immunostimulant; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel nucleic acid molecule encoding botulinum neurotoxin light chain serctype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.
                                                                                                                                                                                                                                                                                                                  (USSA ) US ARMY MEDICAL RES & MATERIAL COMMAND.

```
The invention relates to a nucleic acid molecule encoding a botulinum neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence that is expressible in a host organism other than Clostridium, or has a total A+T content that is less than about 70% The BoNT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental wycolomus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiploe-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin inhibitors. This sequence
Novel nucleic acid molecule encoding botulinum neurotoxin light chain serotype A, useful for producing the neurotoxin for vaccination against botulism, comprises sequence expressible in host other than Clostridium.
                                                                                                                             Claim 13; Page 165-166; 166pp; English

Novel antibody that specifically binds and neutralizes botulinum neurotoxin type A useful for neutralizing botulinum neurotoxin and treating botulism.

Claim 22; Page 23; 31pp; English.

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone \$25, C25, C39, IC6 and clone 1F3, where the antibody binds to and clone \$25, C25, C39, IC6 and clone 1F3, where the antibody acre a courtilises botulinum neurotoxin type A (BoNT/A). Also included are a polypeptide comprising BoNT/A neutralising epitope comprising an epitope comprising bound by the antibody, where the polypeptide is not which is specifically bound by the antibody where the polypeptide is not convel clones and isolating an antibody that specifically bound by an antibody expressed by any of the an epitope specifically bound by an antibody that specifically bound by an antibody comprising to the convel clones and isolating an antibody that specifically binds to the convel convel comprises a VH CDR, where the second anti-BoNT/A antibody which comprises a VH CDR, where the second antibody is useful for neutralising region) and with a second antibody. The antibody which comprises a VH CDR, where the second antibody is useful in the treatment of pathologies associated with botulinum neutrotoxin poisoning, for rapid detection/diagnosis of botulism and in the detection and/or detection/diagnosis of botulism and in the detection and/or detection of BoNT/A in a biological sample obtained from an organism which is indicative of a Clostridium botulinum infection of the organism control antibody (scFv) of the invention

Claim 22; Page 23; 31pp; English.

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone 525, C39, C39, LG6 and clone 1F3, where the antibody binds to and neutralises bothlinum neutotoxin type A (BoNT/A). Also included are a polypeptide comprising BoNT/A neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not a thibody that neutralises BONT/A (by contacting several antibodies with novel clones and isolating an antibody that specifically bound by an antibody expressed by any of the epitope). The antibody is useful for neutralising a BONT/A, by contacting contain mentoroxin type A with the antibody comprising VH CDR (heavy cond anti-BONT/A antibody which comprises a VH CDR, where the second anti-body is useful for neutralising region) and with a second anti-body binds to adifferent epitope than the first anti-BONT/A antibody which comprises a VH CDR, where the second antibody is useful in the treatment of pathologies contained with botulinum neurotoxin poisoning, for rapid associated with botulinum neurotoxin poisoning, for rapid cetection and/or cetection/diagnosis of botulism and in the detection and/or which is indicative of a Clostridium botulinum infection of the organism contain antibody (scFv) of the invention

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone S25, C39, C39, LG6 and clone 1F3, where the antibody binds to and neutralises botulinum neurotoxin type A (BoNY/A). Also included are a polypeptide comprising BONY/A neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not a full-length botulinum neurotoxin H_C fragment and making an anti-BONY/A antibody that neutralisies BONY/A (by contacting several antibodies with convel clones and isolating an antibody that specifically binds to the epitope specifically bound by an antibody that specifically binds to the convel clones and isolating an antibody comprising VH CDR (heavy contacting region variable region complementarity determining region) and with a second anti-BONY/A antibody which comprises a VH CDR, where the second antibody is useful in the treatment of pathologies associated with botulinum neurotoxin poisoning, for rapid detection/diagnosis of botulism and in the detection and/or associated with botulism and in the detection and/or quantification of BONY/A in a biological sample obtained from an organism. The present sequence is a heavy chain variable region (VH) of a single contain antibody (scFV) of the invention

```
The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone $25, C25, C39, IC6 and clone 13, where the antibody binds to and neutralises botulinum neurotoxin type A (BONT/A). Also included are a polypeptide comprising BONT/A neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not a full-length botulinum neurotoxin H c fragment and making an anti-BONT/A antibody that neutralises BONT/A (by contacting several antibodies with an epitope specifically bound by an antibody expressed by any of the novel clones and isolating an antibody that specifically binds to the epitope). The antibody is useful for neutralising a BONT/A, by contacting botulinum neurotoxin type A with the antibody comprising WH CDR (heavy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        chain variable region complementarity determining region) and with a second anti-BoNT/A antibody which comprises a VH CDR, where the second antibody binds to a different epitope than the first anti-BoNT/A antibody. The antibody is useful in the treatment of pathologies associated with botulium neurotoxin poisoning, for rapid detection/diagnosis of botulism and in the detection and/or quantification of BoNT/A in a biological sample obtained from an organism which is indicative of a Clostridium botulinum infection of the organism. The present sequence is a light chain variable region (VL) of a single chain antibody (scFv) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ABU56848 Length: 53 August 31, 2004 14:39 Type: P Check: 8750 Found using 'seq23' (hayes346.key)

Amersdorfer Marks JD,

ď WPI; 2003-182618/18. Novel antibody that specifically binds and neutralizes botulinum neurotoxin type A useful for neutralizing botulinum neurotoxin and treating botulism.

Claim 8; Page 23; 31pp; English

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone \$25, C35, C39, LG5 and clone 1F3, where the antibody binds to and neutralisise botulinum neurotoxin type A (BoNY/A). Also included are a polypeptide comprising BoNT/A neutralising epitope comprising an epitope polypeptide comprising BoNT/A neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not antibody that neutralises BoNT/A My contacting several antibodies with an epitope specifically bound by an antibody that specifically bound by an antibody that specifically bound by an antibody that specifically bound by an antibody comprising vof the covel clones and isolating an antibody that specifically binds to the convel comprises a vice of the variable region complementarity determining region) and with a second anti-BoNT/A antibody which comprises a VH CDR, where the second antibody is useful for meuralising vegion) and with a contibody binds to a different epitope than the first anti-BoNT/A antibody which comprises a vH CDR, where the second antibody is useful in the treatment of pathologies cassociated with botulinum neurotoxin poisoning, for rapid detection/diagnosis of botulism and in the detection and/or antibody is useful for an antibody for a light chain variable region (VL) of a single chain antibody (scFv) of the invention

Novel antibody that specifically binds and neutralizes botulinum neurotoxin type A useful for neutralizing botulinum neurotoxin and treating botulism

WPI; 2003-182618/18.

Claim 6; Page 22; 31pp; English.

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone S25, C39, C39, LG6 and clone 1F3, where the antibody binds to and neutralises botulinum neurotoxin type A (BoNTA). Also included are a polypeptide comprising BONT/A neutralising epitope comprising an epitope of which is specifically bound by the antibody, where the polypeptide is not a full-length botulinum neurotoxin H of fragment and making an anti-BONT/A antibody that neutralises BONT/A (by contacting several antibodies with one pitope specifically bound by an antibody expressed by any of the novel clones and isolating an antibody to expressed by any of the complinum neurotoxin type A with the antibody comprising VH CDR (heavy chilony). The antibody is useful for neutralising a BONT/A, by contacting chain variable region complementarity determining region) and with a second anti-BONT/A antibody which comprises a VH CDR, where the second antibody is useful in the treatment of pathologies contacting antibody. The antibody is useful in the treatment of pathologies associated with botulinum neurotoxin poisoning, for rapid and individual comprises of the pathologies of detection disposes of botulism and in the detection and individual comprises of pathologies of magnificant with horulinum neurotoxin poisoning, for rapid madning quantification of BONT/A in a biological sample obtained from an organism which is indicative of a Clostridium botulinum infection of the organism. The present sequence is a heavy chain variable region (VH) of a single chain antibody (scFv) of the invention

```
The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone $25, C25, C39, IC6 and clone 1P3, where the antibody binds to and clone specifically bound by the A [BoWT/A]. Also included are a polypeptide comprising BoWT/A neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not a full-length botulinum neurotoxin H.C fragment and making an anti-BoWT/A antibody that neutralises BoWT/A (by contacting several antibodies with an epitope specifically bound by an antibody that specifically binds to the cover clones and isolating an antibody that specifically binds to the epitope). The antibody is useful for neutralising a BoWT/A, by contacting coulinum neurotoxin type A with the antibody comprising VH CDR (heavy chain wariable region complementarity determining region) and with a second antibody binds to a different epitope than the first anti-BoWT/A antibody is useful in the treatment of pathologies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              associated with botulinum neurotoxin poisoning, for rapid detection/diagnosis of botulism and in the detection and/or quantification of BoNT/A in a biological sample obtained from an organism which is indicative of a Clostridium botulinum infection of the organism. 24-OCT-2002

Novel antibody that specifically binds and neutralizes botulinum neurotoxin type A useful for neutralizing botulinum neurotoxin and treating botulism. WPI; 2003-182618/18.

Claim 6; Page 22; 31pp; English.

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone \$25, C25, C39, IC6 and clone 1F3, where the antibody binds to and clone \$25, C25, C39, IC6 and clone 1F3, where the antibody and to an epitope comprising BoNT/A neutralising epitope comprising an epitope polypeptide comprising BoNT/A neutralising epitope comprising an epitope comprising boNT/A neutralising epitope comprising an epitope specifically bound by the antibody, where the polypeptide is not antibody that neutralises BONT/A by contacting several antibodies with an epitope specifically bound by an antibody expressed by any of the covel clones and isolating an antibody that specifically bound by an antibody expressed by any of the cepitope). The antibody is useful for neutralising a BONT/A, by contacting botulinum neurotoxin type A with the antibody comprising VH CDR (heavy botulinum neurotoxin type A with the antibody and with a second anti-BONT/A antibody which comprises a VH CDR, where the second antibody is useful in the treatment of pathologies contibody. The antibody which comprises a VH CDR, where the second antibody is useful in the treatment of pathologies associated with botulinum neurotoxin poisoning, for rapid detection/diagnosis of botulism and in the detection and/or detection/diagnosis of botulism and in the detection and/or which is indicative of a Closcridium botulinum infection of the organism. The present sequence is a heavy chain variable region (VH) of a single chain antibody (scFv) of the invention

Novel antibody that specifically binds and neutralizes botulinum neurotoxin type A useful for neutralizing botulinum neurotoxin and treating botulism.

Claim 6; Page 22; 31pp; English.

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone S25, C39, C39, C16 and clone 123, where the antibody binds to and neutralises botulinum neutotoxin type A (BoNT/A). Also included are a polypeptide comprising BONT/A neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not a full-length botulinum neurotoxin H c fragment and making an anti-BoNT/A an epitope specifically bound by the antibody several antibodies with an epitope specifically bound by an antibody expressed by any of the novel clones and isolating an antibody that specifically by contacting contacting several antibodies with contact in type A with the antibody comprising VH CDR (heavy chain variable region complementarity determining region) and with a second anti-BoNT/A antibody which comprises a VH CDR, where the second antibody is useful in the treatment of pathologies associated with botulinum neurotoxin poisoning, for rapid detection/diagnosis of botulinum and in the detection and interpret of pathologies detection/diagnosis of botulinum and in the detection and interpret of pathologies mannification of botulinum and in the detection and interpret of pathologies from an organism ordanism. quantification of BoNT/A in a biological sample obtained from an organi which is indicative of a Clostridium botulinum infection of the organis. The present sequence is a heavy chain variable region (VH) of a single chain antibody (scFv) of the invention

Novel antibody that specifically binds and neutralizes botulinum neurotoxin type A useful for neutralizing botulinum neurotoxin and treating botulism.

Claim 9; Page 23; 31pp; English.

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone \$25, C25, C39, IC6 and clone 1F3, where the antibody binds to and neutralises botulinum neurotoxin type A (BoNT/A). Also included are a polypeptide comprising BONT/A neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not antibody that neutralises BONT/A (Fragment and making an anti-BONT/A antibody that neutralises BONT/A (by contacting several antibodies with an epitope specifically bound by an antibody expressed by any of the novel clones and isolating an antibody that specifically binds to the epitope). The antibody is useful for neutralising a BONT/A, by contacting botulinum neurotoxin type A with the antibody comprising VH CDR (heavy

chain variable region complementarity determining region) and with a second anti-BoNT/A antibody which comprises a VH CDR, where the second antibody binds to a different epitope than the first anti-BoNT/A antibody. The antibody is useful in the treatment of pathologies associated with botulinum neurotoxin poisoning, for rapid detection/diagnosis of botulism and in the detection and/or quantification of BoNT/A in a biological sample obtained from an organism which is indicative of a Clostridium botulinum infection of the organism. The present sequence is a light chain variable region (VL) of a single chain antibody (scFv) of the invention

Novel antibody that specifically binds and neutralizes botulinum neurotoxin type A useful for neutralizing botulinum neurotoxin and treating botulism.

Claim 22; Page 23; 31pp; English.

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone S25, C25, C39, LC6 and clone 1F3, where the antibody binds to and neutralises botulinum neurotoxin type A [BoNT/A]. Also included are a polypeptide comprising BoNT/A neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not a full-length botulinum neurotoxin H\_c fragment and making an anti-BoNT/A antibody that neutralises BoNT/A (by contacting several antibodies with

Novel antibody that specifically binds and neutralizes botulinum neurotoxin type A useful for neutralizing botulinum neurotoxin and treating botulism,

Claim 22; Page 23; 31pp; English.

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone S15, C25, C39, IC6 and clone IF3, where the antibody binds to and neutralises botulinum neurotoxin type A (BoNT/A). Also included are a polypeptide comprising BONT/A neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not a full-length botulinum neurotoxin H\_c fragment and making an anti-BoNT/A antibody that neutralises BONT/A (by contacting several antibodies with

movel clones and isolating an antibody chateseeu by any or the epitope). The antibody is useful for neutralising a BONT/A, by contacting botulinum neurotoxin type A with the antibody comprising WH CDR (heavy chain variable region complementarity determining region) and with a second anti-BONT/A antibody which comprises a VH CDR, where the second anti-BONT/A antibody with comprises a VH CDR, where the second antibody. The antibody is useful in the treatment of pathologies antibody. The antibody is useful in the treatment of pathologies antibody. The antibody is useful in the treatment of pathologies detection/diagnosis of botulism and in the detection and/or quantification of BONT/A in a biological sample obtained from an organism which is indicative of a Clostridium botulinum infection of the organism. The present sequence is a heavy chain variable region (VH) of a single chain antibody (scFv) of the invention of the epitope specifically bound by an antibody expressed by any

Novel antibody that specifically binds and neutralizes botulinum neurotoxin type A useful for neutralizing botulinum neurotoxin and treating botulism.

Claim 22; Page 23; 31pp; English.

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone \$25, C25, C39, IC6 and clone IF3, where the antibody binds to and neutralises botulinum neurotoxin type A (BoNT/A). Also included are a polypeptide comprising BONT/A neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not a full-length botulinum neurotoxin H c fragment and making an anti-BoNT/A antibody that neutralises BONT/A (by contacting several antibodies with)

```
an epitope specifically bound by an antibody expressed by any of the novel clones and isolating an antibody that specifically binds to the epitope). The antibody is useful for neutralising a BoNT/A, by contacting betulinum neurotoxin type A with the antibody comprising VH CDR (heavy chain variable region complementarity determining region) and with a second anti-BoNT/A antibody which comprises a VH CDR, where the second antibody binds to a different epitope than the first anti-BoNT/A antibody is useful in the treatment of pathologies associated with botulinum neurotoxin poisoning, for rapid detection/diagnosis of botulism and in the detection and/or and/or quantification of BoNT/A in a biological sample obtained from an organism which is indicative of a Clostridium botulinum infection of the organism. The present sequence is a heavy chain variable region (VH) of a single chain antibody (sCFV) of the invention

an epitope specifically bound by an antibody expressed by any of the novel clones and isolating an antibody that specifically binds to the epitope). The antibody is useful for neutralising a BoNT/A, by contacting botulinum neurotoxin type A with the antibody comprising VH CDR (heavy chain variable region complementarity determining region) and with a second anti-BoNT/A antibody which comprises a VH CDR, where the second antibody in the antibody than the first anti-BoNT/A antibody. The antibody is useful in the treatment of pathologies associated with botulinum neurotoxin poisoning, for rapid detection/diagnosis of botulism and in the detection and/or quantification of BoNT/A in a biological sample obtained from an organism which is indicative of a Clostridium botulinum infection of the organism. The present sequence is a heavy chain variable region (VH) of a single Sequence 54 AA; \$

Novel antibody that specifically binds and neutralizes botulinum neurotoxin type A useful for neutralizing botulinum neurotoxin and treating botulism.

Claim 22; Page 23; 31pp; English.

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone 825, C25, C39, IC6 and clone IF3, where the antibody binds to and neutralises botulinum neurotoxin type A (BoNT/A). Also included are a polypeptide comprising BONT/A neutralising epitope comprising an epitope a which is specifically bound by the antibody, where the polypeptide is not a full-length botulinum neurotoxin H\_c fragment and making an anti-BoNT/A antibody that neutralises BONT/A (by contacting several antibodies with

an epitope specifically bound by an antibody expressed by any of the novel clones and isolating an antibody that specifically binds to the epitope). The antibody is useful for neutralising a BONI/A, by contacting botulinum neurotoxin type A with the antibody comprising VH CDR (heavy chain variable region complementarity determining region) and with a accond anti-BoNT/A antibody which comprises a VH CDR, where the second antibody binds to a different epitope than the first anti-BoNT/A antibody is useful in the treatment of pathologies associated with botulinum neurotoxin poisoning, for rapid detection/diagnosis of botulism and in the detection and/or quantification of BoNT/A in a biological sample obtained from an organism which is indicative of a clostridium botulinum infection of the organism. The present sequence is a light chain variable region (VL) of a single chain antibody (scFv) of the invention \$

Novel antibody that specifically binds and neutralizes botulinum neurotoxin type A useful for neutralizing botulinum neurotoxin and treating botulism.

Claim 8; Page 23; 31pp; English

The invention relates to an isolated antibody that specifically binds to an epitope specifically bound by an antibody expressed by a clone such as clone S25, C25, C39, LC6 and clone 1F3, where the antibody binds to and neutralises botulinum neutrocoxin type A (BoNT/A). Also included are a polypeptide comprising BoNT/A neutralising epitope comprising an epitope which is specifically bound by the antibody, where the polypeptide is not a full-length botulinum neutrocoxin H c fragment and making an anti-BoNT/A antibody that neutralises BoNT/A (by contacting several antibodies with

an epitope specifically bound by an antibody expressed by any of the novel clones and isolating an antibody that specifically binds to the epitope). The antibody is useful for neutralising a BONT/A, by contacting botulinum neurotoxin type A with the antibody comprising VH CDR (heavy chain variable region complementarity determining region) and with a second anti-BONT/A antibody which comprises a VH CDR, where the second antibody. The antibody which comprises a VH CDR, where the second antibody. The antibody will be useful in the treatment of pathologies associated with botulinum neurotoxin poisoning, for rapid detection/dagnosis of botulism and in the detection and/or quantification of BONT/A in a biological sample obtained from an organism which is indicative of a clostridium botulinum infection of the organism. The present sequence is a light chain variable region (VL) of a single chain antibody (scFv) of the invention Sequence 52 AA;

No detected action on small molecule substrates.
-I-COFACTOR: Binds 1 zinc ion per subunit.
-I-SUBGILLUIS LOCATION: Secreted heterodimer of a light chain (L) and a heavy chain (H).
-I-SUBCILLUIAR LOCATION: Secreted behavospasm associated with the treatment of strabismus and blepharospasm associated with dystonia and cervical dystonia. Also used for the treatment of characterized by abnormal muscle contraction.
-I-MISCELLANBOUS: There are seven antigenically distinct forms of characterized by abnormal muscle contraction.
-I-MISCELLANBOUS: There are seven antigenically distinct forms of botulinum neurotoxin: Types A, B, Cl, D, B, F, and G.
-I-SIMILARITY: Belongs to peptidase family M27.

The botulinum toxin binds with high affainty to peripheral neuronal presynaptic membrane, is then internalized by receptor-mediated endocytosis. The C-terminus of the heavy chain (H) is responsible for the adherence of the toxin to the cell surface while the N-terminus mediates transport of the light chain from the endocytic vesicle to the cytosol. After translocation, the light chain (L) hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking neurotransmitter release. Inhibition of acetylcholine release results in flaccid paralysis, with frequent heart or respiratory
                                                                                                                                                                                                                                                                                                                            Binz T., Blasi J., Yamasaki S., Baumeister A., Link E., Suedhof T.C., Jahn R., Niemann H.; "Proteolysis of SNAP-25 by types E and A botulinal neurotoxins."; J. "The FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER

"The FUNCTION: BOTULINUS TO PERIPERAL NEURONAL SYNAPSES, IS INTERNALIZED

AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD

WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT

INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC

ENDOPERTIDASE THAT CLEAVES THE 76-GLN-|-PHE-77 BOND OF

SYNAPTOREVUN-2.

CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the

neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No

detected action on small molecule substrates.

EMBO J. 12:4821-4828 [1993].

-1- FUNCTION: BOTULING TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERVALIZED
AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
WHERE IT CAN MOVE BETWEEN POSISYNAPTIC AND PRESYNAPTIC NEURONS. IT
INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
ENDOPRETIDASE THAT CLEAVES SYNTAXIN.
                                                                                                                                                                                                                                                                                                                                   -!- CATALTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.
-!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
-!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N- and C-terminal of the heavy chain mediate channel formation and toxin binding, respectively.
-!- SUBCELIULAR LOCATION: Secreted.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              neuroexocytosis apparatus, synaptobrevins, FNAP25 or syntaxin. No detected action on small molecule substrates.
-!- COFACTOR: Binds 1 zinc ion per subunit (By similarity)
-!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N- and C-terminal of the heavy chain mediate channel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                formation and toxin binding, respectively.
-!- SUBCELLULAR LOCATION: Secreted.
-!- MISCELLANDOUS: There are seven antigenically distinct forms of botulinum neurotoxin: Types A, B, Cl, D, E, F, and G.
-!- MISCELLANDOUS: BOTULINUM TYPE D NEUROTOXIN IS SYNTHESIZED BY D STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        or send an email to license@isb-sib.ch).

"E F. FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
"CLEATERASE IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
WHERE IT CAN MOVE BETWEEN POSTSYMAPTIC AND PRESYMAPTIC NEURONS. IT

INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
ENDOPERPTIDASE THAT CLEAVES THE 60-LYS-|-LEU-61 BOND OF
SYNAPTOBREVINS-1 AND -2.

CC -1- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the PARTIAL SEQUENCE.

                                                                                                                                                                                                                                                                                                                                                                                                                                         CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the meroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

COFACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N- and C-terminal of the heavy chain mediate channel
                                                                                                                                                                                                                                                                   MEDLINE=94063091; PubMed=8243676; Schiavo G., Santtuci A., Dasgupta B.R., Mehta P.P., Jontes J., Benfenati F., Wilson M.C., Montecucco C.; Bentenati F., Wilson B.C., Montecucco C.; Botulinum neurotoxins serotypes A and E cleave SNAP-25 at distinct COCH-terminal peptide bonds."; FEBS Lett. 335:99-103(1993).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 formation and toxin binding, respectively.
-!- SUBCELLULAR LOCATION: Secreted.
-!- MISCELLANBOUGS: There are seven antigenically distinct forms of botulinum neuroteoxin: Types A, B, Cl, D, E, F, and G.
-!- SIMILARITY: Belongs to peptidase family M27.
                                                                                               Gimenez J.A., Dasgupta B.R.; "Botulinum neurotoxin type E fragmented with endoproteinase Lys-C reveals the site trypsin nicks and homology with tetanus

"Neurotoxin type E from Clostridium botulinum and C. butyricum;

partial sequence and comparison.";

FASEB J. 2:A1750-A1750(1980)

-!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER

RELEASE. IT BINDS TO PRIPHERAL NEURONAL SYNARSES; IS INTERNALIZED

AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD

WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           STRAIN=BL6340; MEDLINE=91237316; MEDLINE=91237316; PubMed=2033376; Fujin N., Kamura K., Murakami T., Indoh T., Tsuzuki K., Yokosawa N., Yashiki T., Oguma K.; "Cloning of a DNA fragment encoding the 5'-terminus of the botulinum type E toxin gene from Clostridium butyricum strain BL6340."; J. CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the meuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates corrected action on per subunit (By similarity). COPACTOR: Binds 1 zinc ion per subunit (By similarity) (L) and a beavy chain (H). The light chain has the pharmacological activity, while the N- and C-terminal of the heavy chain mediate channel

Yamasaki S., Baumeister A., Binz T., Blasi J., Link E., Cornille F., Roques B., Fykse E.M., Suedhof T.C., Jahn R., Niemann H.; Cleavage of members of the synaptobrevin/YaMP family by types D and Cleavage of members of the synaptobrevin/YaMP family by types D and J. Biol. Chem. 268:12764-12772 (1994).

-:- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER RELEASE. IT BINDS TO PERPERAL NETRONAL SYNARSES, IS INTERNALIZED AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD WHERE IT CAN WOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     STRAIN=Hobbs FT10;

ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 58-GLN- |-LYS-59 BOND OF SYNAPTOBREVINS-1 AND -2.
CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAF25 or syntaxin. No detected action on small molecule substrates.
COFACTOR: Binds 1 zinc ion per subunit (By similarity)
SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N and C-terminal of the heavy chain mediate channel -!- MISCELLANEOUS: There are seven antigenically distinct forms of botulinum neurotoxin: Types A, B, Cl, D, E, F, and G. -!- SIMILARITY: Belongs to peptidase family M27. Type: P Check: 2696 BOTULINUM NEUROTOXIN F, LIGHT-CHAIN.
BOTULINUM NEUROTOXIN F, HEAVY-CHAIN.

Clostridium botulinum. Bacteria; Firmicutes; Clostridia; Clostridiales; Clostridiaceae; Clostridium. MCBI\_TaxID=1491;

STRAIN=113 / 30; MEDLINE=94092745; PubMed=8268233;

SEQUENCE FROM N.A.

01-NOV-1997 (Rel. 35, Last sequence update) 28-FEB-2003 (Rel. 41, Last annotation update) Botulinum neurotoxin type G precursor (EC 3.4.24.69) (BONT/G)

(Bontoxilysin G)

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation-the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch). CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

COFACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N- and C-terminal of the heavy chain mediate channel formation and toxin binding, respectively.

SUBCELUNIAR LOCATION: Secreted (By similarity).

MISCELLANBOUS: There are seven antigenically distinct forms of botulinum neurocoxin: Types A, B, Cl, D, E, F, and G.

SIMILARITY: Belongs to peptidase family M27. BXG\_CLOBO Length: 1296 September 1, 2004 07:06 Type: P Check: 1561 Found using 'seq23' (hayes346.key) BOTULINUM NEUROTOXIN G, LIGHT-CHAIN.

"Organization of the botulinum neurotoxin Cl gene and its associated non-toxic protein genes in Closkridium botulinum C 468.";

Mol. Gen. Genet. 243.631.640(1994).

SUBUNIT: HA IS COMPOSED OF SUBCOMPONENTS HAVING 53, 33, 22-23, AND 17 kba. BOTULINUM TOXINS ARE PRODICED AS PROGENITOR TOXINS OF LARGE MOLECULAR SIZES OF 128 (M TOXIN), 16S (L TOXIN) AND 19S (LL TOXIN). M TOXIN CONSISTS OF A NOWTOXIC COMPONENT AND THE NEUROTOXIN. L TOXIN CONSISTS OF THE M TOXIN AND HA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           STRAIN=Type C Stockholm / C-ST;

J. Blochem. 217:441-455(1993).
-!- FUNCTION: Racl p21/rho GDI heterodimer is the active component of
the cytosolic factor sigma 1, which is involved in stimulation of
the NADPH oxidase activity in macrophages.
-!- SUBUNIT: Forms a heterodimer with rho-GDI.
-!- SUBCELULAR LOCATION: Cytoplasmic and membrane-bound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SEQUENCE OF 1-22; 39-53 AND 60-77.

polarity Cdc42 and

Arf signalling pathways.";
Nature 411:215-219(2001).
-!- FUNCTION: Plasma membrane-associated small GTPase which cycles between an active GTP-bond and inactive GDP-bound state. In active state binds to a variety of effector proteins to regulate cellular. which promote the exchange between GDP and GTP, and therefore dependent manner. Part of a quaternary complex containing PARD3, some PARD6 in a GTP-some PARD6 protein (PARD6A, PARD6 or PARD6G) and some atypical PKC protein (PRKCI or PRKCZ), which plays a central role in epithelial cell polarization. Found in a trimeric complex composed of DocKI and ELMO1, which plays a central role in apoptotic cells. Interacts with RALBPI via its effector domain. Tarricone C., Xiáo B., Justin N., Walker P.A., Rittinger K., Gamblin S.J., Smerdon S.J., "The structural basis of Arfaptin-mediated cross-talk between Rac and responses, such as secretory processes, phagocytose of apoptotic cells and epithelial cell polarization.

ENZYME REGULATION: Regulated by quanine nucleotide exchange factors (GERS) which promote the exchange of bound GDP for free GTP, GTPase activating proteins (GAPs) which increase the GTP hydrolysis activity, and GDP dissociation inhibit tree dissociation of the nucleotide from the GTPRase. SUBUNIT: Interacts with the GEP proteins PREXI, DOCKI and DOCK2, X-RAY CRYSTALLOGRAPHY (2.8 ANGSTROMS) OF 1-177 IN COMPLEX WITH TIAMI bacterial mimic: structure of the Lapouge K., Smith S.J., Walker P.A., Gamblin S.J., Smerdon S.J., Stitinger K.;

-!- SUBCELLULAR LOCATION: Inner surface of plasma membrane possibly with attachment requiring acylation of the C-terminal cysteine (By similarity with RAS).
-!- ALTERNATIVE PRODUCTS:
Event=Alternative splicing; Named isoforms=2;
Name=A; Synonyms=RaclA;
Isold=Pl5154-1; Sequence=Displayed;
Name=B; Synonyms=RaclB, Raclins;
Isold=Pl5154-2; Sequence=Displayed;
Name=B; Synonyms=RaclB, Raclins;
Isold=Pl5154-2; Sequence=VSP_005710;
Note=Has been shown to exist only in human so far;
-!- TISSUE SPECIFICITY: Isoform B is predominantly identified in skin and epithelial tissues from the intestinal tract. The expression of isoform B is elevated in colorectal tumors at various stages of neoplastic progression, as compared to their respective adjacent tissues.
-!- SIMILARITY: Belongs to the small GTPase superfamily. Rho family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GG) GG:0003924; F:GTPase activity; TAS.

Cloning of bovine low molecular weight GTPases (Rac1 and Rac2) and Rho GPD-dissociation inhibitor 2 (D4-GDI).",

Vet. Immunol. Immunopathol. 74:285-301(2000).

-!- FUNCTION: Plasma membrane-associated small GTPase which cycles between an active GTP-bond and inactive GDP-bound state. In active state binds to a variety of effector proteins to regulate cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                responses, such as secretory processes, phagocytose of apoptotic cells and epithelial cell polarization. Seems to be involved in the regulation of the NADPH oxidase (By similarity).

ENZYME REGULATION: Regulated by guanine mucleotide exchange factors (GEFs) which promote the exchange of bound GDP for free GTP, GTPase activating proteins (GAPs) which increase the GTP hydrolysis activity, and GDP dissociation inhibit the dissociation of the nucleotide from the GTPASE. SUBUNIT: Interacts with DOCK2, which may activate it (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              similarity)
--- SUBCELLULIAR LOCATION: Cytoplasmic; membrane-associated when
activated (By similarity)
--- SIMILARITY: Belongs to the small GTPase superfamily. Rho family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

In active state binds to a variety of effector proteins to regulate cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  responses, such as secretory processes, phagocytose of apoptotic cells and epithelial cell polarization. Seems to be involved in the regulation of the NADPH oxidase (By similarity).

ENZYME REGULATION: Regulated by guanine nucleotide exchange factors (GBFs) which promote the exchange of bound GDP for free GTP, GTPsea cativity, and GDP dissociation inhibitors which intoxic hydrolysis activity, and GDP dissociation inhibitors which inthibit the dissociation of the nucleotide from the GTPARSE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -!- SIMILARITY: Belongs to the small GTPase superfamily. ```

state binds to a variety of effector proteins to regulate cellular responses, such as secretory processes, phagocytose of apoptotic cells and epithelial cell polarization. Seems to be involved in the regulation of the NaDPH oxidase.

ENZYME REGULATION: Regulated by guanine nucleotide exchange factors (GBFs) which promote the exchange of bound GDP for free GTP, GTPase activating proteins (GAPs) which increase the GTP hydrolysis activity, and GDP dissociation inhibitors which inhibit the dissociation of the nucleotide from the GTPAse. SUBMIT: Interacts with DOCK2, which may activate it (By

similarity). SUBCELLULAR LOCATION: Cytoplasmic; membrane-associated when +

activated (By similarity)

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch). -!- SIMILARITY: Belongs to the small GTPase superfamily. Rho family.

-! FUNCTION: MAY PLAY A ROLE IN INTRACELLULAR SIGNALING.
-! SUBCELLULAR LOCATION: Cytoplasmic; membrane-associated when activated (By similarity).
-! TISSUE SPECIFICITY: HIGHEST LEVELS IN BRAIN, ALSO DETECTED IN HEART, PLACENTA, AND PANCEAS.
-! INDUCTION: EXPRESSION DOWN-REGILATED IN QUIESCENT FIBROBLASTS AND CLEARLY INDUCED BY SERUM STIMULATION.
-! SIMILARITY: Belongs to the small GTPase superfamily. Rho family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EFFECTOR REGION (POTENTIAL).

SUBCELLULAR LOCATION: Inner surface of plasma membrane possibly with attachment requiring acylation of the C-terminal cysteine (By similarity with RAS).
SIMILARITY: Belongs to the small GTPase superfamily. Rho family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pearce A.;
Submitted (JUL-1998) to the EMBL/Genbank/DDBJ databases.
-!- FUNCTION: RACS ARE PLASMA MEMBRANE-ASSOCIATED GTP-BINDING PROTEINS
WHICH COULD REGULATE SECRETORY PROCESSES, PARTICULARLY IN MYELOID
                                                                                                                                                                                                     3 matches found in sequence:

Fempirical analysis of transcriptional activity in the Arabidopsis -!- SUBCELLULAR LOCATION: Membrane-associated. Plasma membrane, some endomembrane compartment and cell plate in dividing cells.
-!- TISSUE SPECIFICITY: Ubiquitous, with a strong expression in root tips, ovules, very young leaves, vascular tissue, hydathodes, stipules and the abscission and dehiscence zones of the siliques:-!- INDUCTION: Locally and systemically induced by pathogen infection and localy only by mechanical stresses.
-!- MISCELLANEOUS: Specifically cleaved by the botulinum neurotoxins function in the secretory pathway.
-!- SUBUNIT: Interacts with the cytokinesis-specific syntaxin KNOLLE and with SYP121. Sequence features of the regions of 1,044,062 bp covered by thirteen physically assigned PI clones."; DNA Res. 4:291-300(1997). "The expression of the t-SNARE AtSNAP33 is induced by pathogens and mechanical stimulation."; Plant Physiol. 132:343-351(2003). Plant Physiol. 132:343-351 involved in diverse vesicle trafficking and PUNCTION: T-SNAST involved in diverse vesicle trafficking and membrane fusion processes, including cell plate formation. May SIMILARITY: Contains 1 t-SNARE coiled-coil homology domain. Wick P., Gansel X., Oulevey C., Page V., Studer I., Durst M., Sticher L.; Brover V., Troukhan M., Alexandrov N., Lu Y.-P., Flavell R., Feldmann K.A.; MEDLINE=21576055; PubMed=11718726; Argoul J., Gansel X., Tyzrell M., Sticher L., Blatt M.R.; "Protein-binding partners of the tobacco syntaxin NtSyrl."; FEBS Lett. 508:253-258(2001). CHARACTERIZATION, AND INTERACTION WITH KNOLLE AND SYP121. "Full-length cDNA from Arabidopsis thaliana."; Submitted (MAR-2002) to the EMBL/GenBank/DDBJ databases. SEQUENCE FROM N.A. STRAIN=cv. Columbia; MEDLINE=22954850; PubMed=14593172; MEDLINE=22631601; PubMed=12746539; Science 302:842-846(2003) SEQUENCE FROM N.A. INDUCTION genome.

tetxclote; Tetanus toxin precursor (EC 3.4.24.68) (Tentoxylysin) [Contains: (from "bt\_sp.pep")

-!- FUNCTION: TETANUS TOXIN ACTS B. INHIBITING NEUROTRANSMITTER

-!- FUNCTION: TETANUS TOXIN ACTS B. INHIBITING NEUROTRANSMITTER

RELEASE. IT BINDS TO PERIPHEREAL NEURONAL SYNAPSES, IS INTERNALIZED

AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD

WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT

INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC

ENDOPEPTIDASE THAT CAPALYZES THE HYDROLYSIS OF THE 76-GLN- |-PHE-777

BOND OF SYNAPTOBREVIN-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SYNADCOEVEN 2.

COPACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
AND ARE NON-TOXIC AFTER SEPARATION.

MISCELLANBOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
GANGLICOSIDE RECEPTORS.

SIMILARITY: Belongs to peptidase family M27.
